**CNBC Stocks Channel 'journalist' lies saying only \$1 trillion  
spent to prop up banks, insurance companies as Ron Paul  
documented \$14 trillion! Canada's zionist Reisman also lied!**

**From Ron Paul, U.S. Congressman:  
Dear Friend of Liberty,**

I hope you join me in my firm conviction that now is the time to fight back against the out of control Federal Reserve and continued Wall Street plundering of our tax dollars.

The threat isn't hard to see -- just look all around us. Our constitutional principles and freedoms are being assaulted at every turn. More bailouts, trillion dollar "stimulus" plans, huge new debt burdens for our children, simply printing money to cover our failed policies -- I could go on and on. You and I both know that President Obama is going to keep going and going unless someone puts a stop to the madness.

But the good news is there is a way to fight back. And that fight starts today -- by "Auditing the Fed" and showing the American people just how the Fed has abused its power, debauched the dollar, and helped strangle our economy.

Because I know you are a friend in Liberty, I wanted you to be among the first people contacted by Campaign for Liberty for the vital fight against the out of control Federal Reserve. Please read the enclosed letter from my friend and Campaign for Liberty's President, John Tate. John isn't just a friend of mine. He's also a patriot with years of experience getting things done in politics. Now he's agreed to take up the fight in a way I cannot -- by leading the fight for Liberty on the outside, while I do battle in the halls of Congress. I trust you'll find this battle to expose the out of control Fed worth your support.

**For Liberty,  
Campaign for Liberty  
Congressman Ron Paul  
Campaign for Liberty  
Dear Friend of Liberty,**

**Trillions of dollars are being  
stolen from the U.S. taxpayer.**

Right now, you and I are seeing the worst plundering of a country's wealth in the history of civilization, led by an out of control Federal Reserve.

But together you and I CAN put a stop to it all. With your help (including submitting the petition linked below to your Congressman and Senators) today, Representative Ron Paul, Senator Jim DeMint and Campaign for Liberty are ready to fight back, by taking the battle straight to the heart of the problem -- the Federal Reserve itself. Just think about the scope of the problem for a minute:

The massive, outrageous amount of dollars committed to the economic bailouts in recent months totals:

More than the socialist New Deal ... More than the entire Iraq debacle ... More than the 1980's savings and loan mess ... More than the Korean War ... COMBINED.

**When will it all end?**  
It's time you and I put a stop to a renegade Federal Reserve by exposing the Fed's out of control actions to the American people. And Congressman Ron Paul and Senator Jim DeMint have a bill before Congress to do just that, known as the "Audit the Fed" Bill (HR 1207 and S 604).

That's why it's vital you click here to submit your "Audit the Fed" petition in support of Congressman Paul's bill.

**Campaign for Liberty**  
You see, Audit the Fed already has over 300 co-sponsors!  
Now is the

time to make sure your Congressman and Senators feel the heat to support the Audit the Fed bill!  
If you and I don't act today, I'm afraid this crisis will end with the economic ruin of every man, woman and child in America.

Today, nearly 13 TRILLION in taxpayer dollars in bailouts and loans has been agreed to by Congress, the Bush and Obama Treasury Departments, and the out of control Fed.

So is it really any wonder more and more folks are starting to realize the Washington, D.C. establishment is hurting us toward complete economic disaster?

Whether it's watching a phony "stimulus" package get rammed into law or watching Congress pass a \$700 BILLION bank "bailout" under threat of martial law, the American people are agitated and increasingly angry.

That means it's a perfect time to unleash the pres-

sure of MILLIONS of outraged Americans on the out of control Fed!

So please click here to sign the petition linked below urging your Congressman and Senators to cosponsor and seek roll call votes to pass the Audit the Fed Bill!

**Campaign for Liberty**  
As I know you're aware, the Federal Reserve is shrouded in secrecy. Their meetings are off-limits to the public. Their inner workings are off-limits to the public. And just recently, the Federal Reserve told Congress "NO WAY" when asked to account for \$2 TRILLION in taxpayer-backed loans!

Well, why do you think they refused? They know coming clean with Congress and the American people on how they doled out that two TRILLION dollars would result in an anti-Fed firestorm.

So can you imagine the impact of a full-scale audit? You and I will finally be able to show the American people that the Federal Reserve System leads to:

\*\*\* Constant economic crises -- the housing crisis and the resulting chaos is just one example of an economic bubble created by centrally-planned interest rates and money manipulation.

\*\*\* The destruction of the middle class -- as fuel, food, housing, medical care and education costs soar, everyone who is NOT on the government dole is forced to make do with less as the value of their money slowly decreases.

\*\*\* Currency destruction -- history shows us that riots, violence and full-scale police states can result when people finally realize our money is worth the paper it's printed on and REFUSE to accept it.

And unless you and I do end the madness in Washington, D.C., we may be closer than we'd like to think to learning that history lesson firsthand -- right here in our own streets.

**Goldman Sachs CEO Blankfein  
apologizes for sleazy actions!

**Truth for Canadians::  
stoplying.ca**

Toronto Street News educates Canadians about the facts on finances, health, the need for peace in the world. The website [stoplying.ca](http://stoplying.ca) does a terrific job. For those not able to see the Sydney White lectures at the Free University of Toronto -- we recommend viewing [stoplying.ca](http://stoplying.ca) with interviews of Canadian politicians -- some of whom know the truth about banks but are afraid to speak out. This includes Jack Layton of the NDP and Liz May of the Green Party.

These party leaders know the truth about Canada's failure to issue its own money from the Bank of Canada -- instead we pay private banks \$160 million a day in compound interest -- something we will never pay back. Former PM Paul Martin falsely claims that it would be inflationary to issue our own money; instead we pay compound interest to private banks which far outstrips any claim of "inflation". Martin asked his aide to stop questions on this question as did Heather Reisman at Martin's book launch. Canada's PMs are personally compromised by bankers.

"The Fed is counterfeiting!" "How do you charge people with fraud when the government is committing fraud?" He promotes his book: "End The Fed"

**Monsanto GM Wheat on the way after EU bars Canadian corn**

Five years after scrapping its trials, Monsanto calculates that the time is now ripe for GM wheat to make a comeback.

**Henry Miller and Colin Carter guard  
in.ca.co.uk.**  
Wheat is a critical staple crop, supplying much of the world's dietary protein. In 2007 world production was 607m tonnes, making it the third most-produced cereal after maize and rice. The grain is used to make breads, biscuits, cakes, breakfast cereal, pasta, noodles, and couscous, and for fermentation to make beer, vodka, and grain alcohol. Up to now, wheat has not benefited from the application of modern genetic engineering that has revolutionised the farming of maize, cotton, canola and soy. But that is about to change.

By 2004, Monsanto, the world's leader in the production of seeds for genetically engineered crops, had made substantial progress in the development of genetically-engineered wheat varieties for North America. But suddenly in that year, the company scrapped its wheat programme, in part because of opposition from North American grain merchants and growers, as well as concerns that some major foreign importers would reject imports of all American wheat because they could be "contaminated" with genetically engineered varieties. European countries and Japan, which have traditionally imported about 45% of US wheat exports, have been resistant to genetically engineered crops and food derived from them.

In addition, food manufacturers doubted that the introduction of genetically engineered wheat would lead to a significant improvement in their profits because the cost of wheat is typically only a small fraction of inputs for most processed food products, and food processors were afraid of losing market share if environmental and consumer activists were to organise boycotts of food products containing "biotech" wheat.

For the last 25 years, activists have opposed biotechnology, in spite of proven environmental, humanitarian and economic successes.

Monsanto's abdication gave competitors outside the US the opportunity to become the first to adopt new technologies for genetically improved and lower cost wheat, relinquishing what could have been a first-mover advantage -- the privileged position of the initial occupant of a market segment.

However, American growers and millers have had a change of mind. In 2006, a coalition of US wheat industry organisations called for access to genetically-engineered wheat varieties with enhanced traits, and a survey released in February 2009 by the US national association of wheat growers found that more than three-quarters of US farmers wanted access to genetically engineered varieties with resistance to pests, disease, drought and frost. Such varieties are important as plant scientists and farmers continue to battle diseases such as leaf rust, the world's most common wheat disease, which can lead to yield loss of up to 20%. In Kansas, the heart of the US wheat belt, for example, leaf rust is the most significant pest.

American growers, caught in the middle between the inclinations of some of their largest customers and the developers of new wheat varieties, lost out on substantial benefits when Monsanto opted not to follow through with creating genetically-engineered wheat. This left the field by (literally and figuratively) to countries such as Australia and China, which are now ahead in their research and field trials of genetically-engineered wheat. For example, the German plant science and chemical company Bayer and Australia's Commonwealth Scientific and Industrial Research Organisation (CSIRO) are collaborating to develop wheat varieties with higher yield, more efficient nutrient use and greater tolerance against drought.

These developments are important for several reasons. Wheat farming is a struggling industry in the US, in large part because it has not received the technological boost from recombinant DNA technology that has benefited the corn and soybean industries. US wheat acreage is down by about one-third from its peak in the early 1980s, due to reduced profitability compared with alternative crops -- in spite of the price of a bag of wheat flour having soared from \$10 to a peak of \$36 during the past 36 months. As a result, the US's position as a leading wheat exporter has declined over several decades, from a high of 50% of world exports in 1973-74 to only around 20% currently.

Five years after letting their biotech wheat research program wither, Monsanto recently revealed plans to resurrect it. The agribusiness company not only announced in July 2009 that it would resume development of genetically engineered wheat varieties, it also further demonstrated its commitment

by buying WestBred, a Montana-based wheat and breeding company that specialises in wheat germplasm, the plant's genetic material.

Greater productivity in wheat farming achieved with improved varieties would confer an important environmental dividend: wheat is the largest crop in the world in terms of area cultivated (220m hectares) and is the second largest irrigated crop (each bushel produced requires 11,000 gallons of water on average), so enhanced productivity would conserve both farmland and water. (A more direct approach is being taken by scientists at Egypt's Agricultural Genetic Engineering Research Institute, who have performed at least five years of field trials of drought- and salt-tolerant wheat created by transferring genes from barley into a local wheat variety.) Monsanto's volte-face reflects the company's assessment that the various relevant factors -- technology, business, public policy and customer acceptance -- had now become favourable, and was spurred by the world food crisis that saw a tripling of the price of wheat and certain other food crops during 2008. But it will likely take at least eight years until the first varieties of Monsanto's genetically-engineered wheat could be commercialised in the United States.

Monsanto and the US wheat industry may already have been relegated to the position of second mover, and whoever wins the race to get desirable genetically engineered wheat varieties to the marketplace will enjoy a strong cost advantage and attract market share in many importing countries.

Henry Miller is a fellow at the Hoover Institution and the author of The Franken-food Myth. Colin Carter is professor of agricultural and resource economics at the University of California at Davis.

**Monsanto family were slave owners.**

spreading hazardous chemicals and heavy metals on their fields, lawns and gardens.

Meanwhile, Michael Mack, the chief executive of Syngenta, a Swiss agribusiness giant that makes pesticides, is waging war against the organic movement as a whole. He argues that, "Organic food is not only not better for the planet. It is categorically worse."

Of course, Mr. Mack dismissed the notion that Syngenta, a company that sold nearly \$12-billion worth of "crop protection" technologies last year, felt threatened by the organic movement.

**Toxic Sewage  
Sludge in Your Food**

by: Dr. Mercola  
The increasing use of sewage sludge as fertilizer for your food is an under-publicized and often hidden threat.

Sludge is the toxic mix that is created by our municipal wastewater treatment facilities. Just about anything that is flushed down toilets or that ends up in sewers is in this sludge; the pollutants in sludge come not just from household sewage, but also from every hospital, industrial plant, and stormwater drain. For a long time, sludge was simply

dumped in the oceans. Over time, it became apparent that this was an environmental and human health disaster. An alternative solution has been pushed since the 1980's by the U.S. government. The EPA determined that a good way to dispose of treated sewage sludge was to legally distribute it as a cheap alternative to fertilizer.

Unsurprisingly, scientific analysis of the poisons in sewage sludge shows it's the wrong, and dangerous, solution for U.S. farmers and communities. Unfortunately, many American farmers and gardeners are unknowingly using sludge-derived "compost," which is given away free in many cities throughout the United States.

As a result, farms and homes across the country have been unknowingly
